4. Cookly
5. An application where you input ingredients in your fridge or pantry and it returns recipe options from a database. Input ingredients using pictures and have an AI examine them to determine what ingredients the user has. Save ingredients in between uses so the user doesn't need to constantly retake pictures. Include a survey at account creation that prompts the user for food tastes, dislikes, and cookware.

    The first step for a user, after they have logged in, is to take an image of the ingredients they already have and upload it to the app. After the image is uploaded, the app will use AI to pick out the ingredients from the image and store them in a database. The user can upload multiple images incase one is not enough. The AI will also sort the ingredients by their type, i.e. protein, condiment, grain, fruit, vegetable, starch, etc. Importantly ingredient quantities will also be taken into account.

Once all the available ingredients have been added to the database, the app will then find recipes that only use the ingredients from the database. The app will return a list of qualifying recipes for the user to then choose between in order to streamline cooking, while being more efficient and less wasteful. This app not only makes cooking easier but it also helps eliminate waste by ensuring ingredients don't go to waste inside one's fridge.

6. The target audience for this application are people who want to cook but don't necessarily have enough time to meticulously plan out all of their meals. There are many people who enjoy cooking but don't have time to visit the grocery store every single week to buy specific ingredients for pre-planned recipes. This takes a lot of planning and preparation every single week which just isn't realistic for most people living busy lives. Our application simplifies with process by curating recipes using ingredients that our users already have in their fridge. This cuts out the entire step of planning recipes and going out to buy the specific ingredients. This also solves the additional problem if the store is out of a specific ingredient needed for a recipe. Our app completely eliminates this issue.
7. For busy professionals, who need to cook. Cookly is a recipe generator that helps people find recipes that use their ingredients and cookware. Unlike Supercook, Cookly is forward thinking and ready to support people in any type of kitchen, with any dietary needs, or cuisine preferences.
8. Version Control: Github Link - https://github.com/BraydenHogue/3308Project
9. Agile methodology

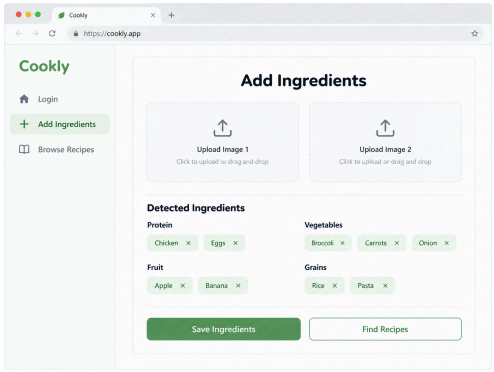

10. We’ll communicate over MSTeams, giving updates when we finish sections and communicating ideas and next steps.
11. We’ll do our group meetings during Lab each week as well as our TA meetings
12. A. Create a login

    B. Log in

    C. Take photo of fridge/pantry

    D. Identify ingredients

    E. Filter recipes

    F. View recipes and instructions
13. 

Extra credit:

1. Food allergy: This is a very severe risk as it could get someone extremely sick or even be deadly. If a user has some sort of food allergy or intolerance and our app includes it as an

ingredient in a recipe. One way to mitigate this risk is for a user to specify foods or ingredients they are intolerant to and the app will blacklist those ingredients.

2. Non edible items in the fridge: Could return recipes that involve ingredients the user does not have. To mitigate the AI will prompt the user to confirm or deny whether each ingredient is what it thinks before moving on to the recipes
3. Bad Recipes: If people consistently don't like the recipes they are suggested, they will stop using the app. We can counteract this by suggesting multiple different recipes for each request and we can implement a rating system for recipes to build a taste profile for each user.
4. Expensive AI API use: Give users the ability to enter ingredients manually when AI is unavailable or making mistakes. We can use open source models from hugging face running on personal computers to reduce energy cost.
5. Constraints: Some recipes could require cookware or time that the user doesn't have. To mitigate this Cookly can give a wide range of recipes with different requirements, workloads, and time needs.
